

How Does Recycling Help the Environment?

Erendira Garcia

Grade: 4th

3rd Place- Grades 3- 5

East Avenue Elementary School

I want to tell you about how recycling helps the environment. Here are some examples, and how we use and need them.

When we recycle paper we save trees. Trees help us breathe and if we don't recycle we won't be able to breathe as well as we do with trees. If we recycle as much as we can, our oceans and beaches will be cleaner and more beautiful. We could make a lot of things out of the things we recycle. Be creative! Try to make things with them. You will have loads of fun!

Why don't people recycle? A simple question but with a lot of different answers. Now, if we do the right thing and not pollute, our earth will be safe for future generations. For example, just don't leave garbage lying around so our wild animals and pets will be healthy. It's as easy as 1-2-3!

When the world gets polluted it works like a glass of water: if you take a glass of clean water and put dirt in it, you can't drink it anymore. The same thing with the earth, put garbage all over it, and you can't take clean showers, eat good food, or drink clean water. And who would like to live in a world full of junk? I certainly wouldn't. So, please pass that message on to your families and friends!

These are some examples of how and why we need to recycle. You can help clean up a certain area or put more garbage cans around your neighborhood and home. These are only two ways. There are lots more. And remember to recycle!
